Blood Will Tell

0	Background	
	☐ Vampire Biology	
	 "Dracula" virus rewrites human DNA into vampire DNA so that as cells replicate, they form 	
	vampiric stem cells. The virus attacks the nervous system first, putting the victim into a cor	
	preserving the brain while the rest of the body stops functioning and is rebuilt into a vampi	
	The process of going into the coma is very painful as nerves are ripped apart and rebuilt ur	
	brain is reached and the pain centers disabled. After awakening, the body is tender for about the same at the same	out a
	day as well.	ri o
	The virus builds on the basic human DNA, keeping the core parts and adding on the vampi "extras". The stuff that's not needed is tossed. The result is that after rebuilding, the victim	
	to look as good as possible for their age a good portion of aging is the result of DNA da	
	and the virus can't fix that. Sometimes, the DNA is damaged too much, and the result is ra	
	like when you tell an image editor to automatically fix a photograph: sometimes the result to	
	like abstract art. Biological "abstract art" is very messy	ONO
	 One of the vampiric additions is an enzyme, vampirease ("can *you* think of a better name) 	?"),
	that catalyzes a reaction that consumes hemoglobin to produce energy. Quite a lot of energy	
	produced, allowing the conversion to a vampire to complete solely from the blood in the vic	
	and after the conversion, to provide the energy to power the superstrength muscles. Inacti	ve
	cells require no more energy than humans, and thus while a vampire can in fact starve to d	
	it would take quite a long time. This reaction is the sole source of energy for a vampire, so	
	cannot suffocate, and the brain is not damaged by the conversion process when the victim	is
	"dead" (in the conversion coma).	
	The extra energy allows enhanced brain function, so a vampire needs no sleep and is a somewhat smarter than the human it used to be. In addition, the enhanced function includes the same of the sa	20.0
	weak ability to control human minds. A single vampire can only suggest, and only a very w	
	mind can be in any way "controlled". But a number of vampires can get together, and when	
	something too public occurs, a group of "Sanitizers" will "convince" any witnesses that som	
	mundane actually occurred. Usually, the witnesses don't want to believe what they saw an	
	so it's not too difficult a task. The converse of the coercive effect is that strong emotions ar	
	truth of a statement can be discerned by a vampire focusing on an individual. Thus, a com	mon
	occupation for mainstreamed vampires is as detectives and police. It also allows them to c	over
	up non-mundane incidents.	
	As a hunter, the vampire has a much improved sense of smell, and can identify to some dependent of the same of	
	the odors present at any moment. Since smell is a large portion of taste, and that sense is	very
	heightened, vampires do not like strong foods.	form
	• The digestive system works, but doesn't absorb anything from the food except water and a	
	vitamins, etc, that even vampires need. They eat lightly because minimal processing mear it tends to run through the system pretty fast.	S IIIai
	 The main source of nourishment for a vampire are the fangs, which are only about a quarte 	r of an
	inch long, but hollow. Blood is sucked into them and run through a sort of gill that filters or	
	hemoglobin, which is passed into the blood, while the rest is dumped down the throat.	
	 Vampirease is unstable in the presence of ultraviolet light, which causes the catalyzation p 	ocess
	to become uncontrolled: i.e. a vampire will catch fire, or even explode, in unfiltered sunligh	
	An enzyme in wood and an enzyme in garlic both also cause the catalyzation process to lo	se
	control, but because the usual application of these is in limited quantities, the results are le	
	spectacular than full sunlight. Still, staking in the heart with all the blood filled with vampire	
	contact with the stake tends to result in a pretty violent result you don't really want to do	
	old hand on the stake routine. More like an arrow at some distance. The odor of garlic car	
	tiny amount of the enzyme not enough for spectacular results, but enough to cause mod	
	pain to a vampire breathing it. If necessary, it can be tolerated, but requires strong force of	
	 Silver, on the other hand, has the opposite effect: it catalyzes destruction of vampirease, as as a slow poison that has the effect of starving/suffocating a vampire (both processes in hu 	
	combine to provide the energy for the human body that vampirease reacting with hemoglob	
	does for vampires). A silver hollowpoint bullet (which will expand for more surface area, a	
	as more likely to stop and stay in the body to stay in contact with the enzyme) is sufficient t	
	vampire, but probably not before he's had time to dispatch the shooter unless they're quick	
	shooting at a distance.	
	The Dracula virus and related cells remain in the system in large numbers, which in combine the combine of t	ation

Blood Will Tell

with energy available from vampirease, provides for extraordinarily fast healing, as well as	s quick
destruction of any foreign element, such as other virii or bacteria. A drug has been developed, Libiracin, that "liberates" vampires from classical restrictions	· i+
interferes with vampirease just enough to stabilize it and slow it down enough that ultravio	
no longer causes the reaction to runaway, though it does still speed it up a little. The slov	
effect results in less consumption of hemoglobin, but also less energy and stamina (relative	
vampires, but still a little more than the typical human). Vampires taking Libiracin get hott	
sun that just from the warming rays because of the increased reaction rate, as well as ne	eding to
drink more blood, even than non-drugged, shaded vampires, but the lowered energy and	ł
stamina is reversed. The same is true of healing: slower in the dark than in the sun.	
 Crosses, holy water and invisibility in mirrors are just old wives tales used to embellish the 	
stories. Holy water and crosses were something spread by priests trying to convince une masses to join the church. Occasionally, holy water did work, but did so only when the w	
had been sitting in a silver bowl long enough to dissolve some of the metal, and the vamp	
already had numerous cuts for the poison to infiltrate through. Sometimes garlic was soa	
the water as well, for a particularly effecatious weapon, which tended to open sores on the	
so the silver tainted water could get in to poison the system.	
□ Vampire culture	
There are those for whom the raw power and violence are an attraction, as well as the thr hunt and escape.	riii of a
 As a result, there is an underground vampire police network to keep them from drawing to 	oo much
attention and starting a new witch hunt, though occasionally an incident occurs that they	
deal with in time and it ends up in the tabloids.	
A conservative segment doesn't like the changes and assimilation that Libiracin allows an	
fight its use, considering it a "weakening". They try to create reports and evidence that it	causes
cancer in humans to destroy the cover market. ☐ Alex	
● □ Born in 1928

Word spread quickly, and he became wealthy building a pharmaceutical compa. The drug also prevents ultraviolet rays from damaging human skin, though at the expense preventing a tan as well (which doesn't happen unless there's skin damage). So an addit sibling drug was developed to trigger melanin production, and he became one of the worl richest people. In order to avoid the non-aging issue, he disappeared gracefully by selling the company to vampire-owned holding company, which would ensure the drug continued to be produced. The company was set up with a minimum of three widely sp	, but ame, nological came rigerator craving. o avoid ly was ty is to mply idden Alex's any. e of tional d's o a ties. to
 Converted at the age of 25 when bitten during sex with a one night stand. He awoke alor with no idea what had happened. Fortunately, there was no direct sunshine onto his bed when he got up, feeling very tender, a hand fell into a beam of sunlight, flared up with a fla and burned him badly and painfully. While staring at the burned hand, he went into psych shock as he watched it heal right in front of him. After the healing was completed, he bee aware of a strong craving for raw meat, the bloodier the better. He had a steak in the refr and discovered his new fangs when he bit into the steak. Instinctively, he poked holes throughout the steak, sucking it dry of any liquid. It tasted "off", but briefly quenched the company to the sun. Newly aware, roaming at night, he discovered the vampire society and eventuall given the education his trick was supposed to give him (one of the rules of vampire societ either kill by sucking the body completely dry of blood and then make it "disappear", or sir infect and convert, and then train the newly "born again" vampire in the ways to remain hi and not be a danger to the secret society). Violation of this "prime directive" meant that A trick had a very short life expectancy, immortal or not. Did residency on night shifts and worked as night shift emergency room doctor Researched during the day, discovered the enzyme the powers vampires and developed Libiracin. Word spread quickly, and he became wealthy building a pharmaceutical compather drug also prevents ultraviolet rays from damaging human skin, though at the expense preventing a tan as well (which doesn't happen unless there's skin damage). Blood Will Tell

- followed the gay rights movement discreetly, though got found out once which forced him to change identities after only 3 years instead of the usual 10. He did a stint as a private investigator in order to keep from running into people he might have known only 13 years ago at the biomedical research facility he would otherwise have gone to. This allowed him to learn techniques for both finding people and things as well as being better able to cover his tracks.
- Since the 90's, he's been able to be out as gay, and for the last six months, has been seeing Ben. Ben is ready to move in, and practically lives with Alex as it is. Alex is resisting, but knows that decision time is near: he loves Ben, and there's only one way the relationship can last very long: Ben must become a vampire too, but having been involuntarily converted and abandoned to find his own way, Alex was determined to make sure Ben knew everything ahead of time. This was very risky, because if Ben reacted badly, he would be killed before he could endanger the vampire world, and Alex would be as well if he didn't do it himself to clean up his own mess.
